

To build your backend and test your AI engine without having formal, signed contracts with partners like *Every. Foods*, *Löwenanteil*, or *Urban Sports Club*, you have to use a strategy called **Data Mocking and Scrape-Seeding**.

In the software world, you do not wait for a company to give you their official API keys to start building. You create a simulation of their data first.

Here is the exact step-by-step developer playbook on how to get, structure, and use partner data right now while your app is at zero.

Step 1: Getting the Nutrition Data (The SKUs & Macros)

You need a database of real German meal-prep products so your AI can practice mapping a user's caloric needs to real food.

How to get it right now:

1. **Manual CSV Seeding:** Go to the websites of *Every. Foods*, *Löwenanteil*, or *Factor Meals*. They openly display their menus, ingredients, and nutritional values for compliance reasons.
2. **Copy the Data:** Pick 10–15 core meals from their websites. Copy their name, calorie count, protein, carbs, fats, and price into an Excel or Google Sheet.
3. **Assign Fake SKUs:** Create your own internal tracking codes for them (e.g., **MOCK-EVR-001** for an *Every. Foods* bowl).

How to structure it for your Backend:

Save this sheet as a **.csv** or **.json** file and import it into your database (e.g., PostgreSQL or MongoDB). Your database structure should look like this:

JSON

```
{
  "mock_sku": "MOCK-LOEW-005",
  "partner": "Löwenanteil",
  "meal_name": "Chili Con Carne (High Protein)",
  "price_eur": 6.99,
  "calories": 580,
  "protein_g": 45,
  "carbs_g": 52,
  "fats_g": 14,
  "image_url": "https://example.com/mock-chili.jpg"
}
```

- **Why this works:** When you finally sign an official deal with *Löwenanteil* later, you will simply replace your fake **"mock_sku"** codes with their official warehouse codes. Your AI logic won't have to change at all.

Step 2: Getting the Workout Place Data (The Urban Sports Club Simulation)

You want your AI to be able to say: *"Go to Studio X which is 5 minutes away."* To test this, you need geographic location data for sports venues.

How to get it right now:

Instead of trying to hack the private Urban Sports Club API, use the **Google Places API** or open-source map data (**OpenStreetMap**).

1. Create a free Google Developer account and use the Places API.
2. Run a query for your test city (e.g., "Frankfurt Westend") filtering for keywords like **gym**, **pilates studio**, **bouldering**, or **swimming pool**.

3. Download a list of 20 local fitness venues with their names, latitudes, and longitudes.

How to structure it for your Backend:

Tag these venues in your database with the fake USC membership levels (M, L, or XL) they would likely belong to:

JSON

```
{  
  "venue_id": "V-FRA-091",  
  "name": "Pure Pilates Frankfurt",  
  "address": "Mainzer Landstraße 45, 60329 Frankfurt",  
  "latitude": 50.1103,  
  "longitude": 8.6635,  
  "usc_tier_allowed": "M",  
  "sport_type": "Pilates"  
}
```

Step 3: Building the "Mock API" Environment

Now that you have your data tables for food and fitness locations saved in your backend, you build a **Mock API**.

Instead of sending a live request over the internet to *Wolt* or *Every. Foods*, your app sends a request to your *own* database.

1. Your AI calculates: *"User needs 580 calories and a Pilates class near coordinates 50.1103, 8.6635."*
2. Your backend searches your internal mock files.
3. Your app successfully displays: *"We ordered your Chili Con Carne (MOCK-LOEW-005) and booked Pure Pilates Frankfurt (V-FRA-091)."*

How to Transition to Real Partner Data Later

Once you have a working prototype built on this fake data, you have immense leverage. When you approach the business development heads of *Every. Foods* or *Urban Sports Club* in Germany, you don't just pitch an idea. You open your laptop, show them the working simulator, and say:

"Look at this. We have already mapped your entire catalog into our AI matching engine. Our users are ready to order your products automatically. We just need to replace our mock data database with your official API documentation keys to launch."

This positions you as a highly professional tech founder, making it incredibly easy to get those official data partnerships signed.
